The Flow Properties of Disperse Systems with Particular Reference to Blood

S. G. Mason

(Pulp and Paper Research Institute of Canada and Department of Chemistry, McGill University, Montreal, Canada)

The translation, rotation and deformation of single small spherical and cylindrical particles suspended in Newtonian liquids subjected to steady and oscillatory laminar shear flow are described. The effect of particle and wall interactions on the velocity distribution and energy dissipation in concentrated suspensions are discussed. The application of this work to blood flow in the vessels of the animal will be reviewed.
